88. Merge Sorted Array

```
Easy ₼5739 Ф514 ♥Add to List ₼Share
```

You are given two integer arrays <code>nums1</code> and <code>nums2</code>, sorted in **non-decreasing order**, and two integers <code>m</code> and <code>n</code>, representing the number of elements in <code>nums1</code> and <code>nums2</code> respectively.

Merge nums1 and nums2 into a single array sorted in non-decreasing order.

The final sorted array should not be returned by the function, but instead be *stored inside the array* nums1. To accommodate this, nums1 has a length of m + n, where the first m elements denote the elements that should be merged, and the last n elements are set to 0 and should be ignored. nums2 has a length of n.

Example 1:

```
Input: nums1 = [1,2,3,0,0,0], m = 3, nums2 = [2,5,6], n = 3

Output: [1,2,2,3,5,6]

Explanation: The arrays we are merging are [1,2,3] and [2,5,6].

The result of the merge is [\underline{1},\underline{2},2,\underline{3},5,6] with the underlined elements coming from nums1.
```

Example 2:

```
Input: nums1 = [1], m = 1, nums2 = [], n = 0
Output: [1]
Explanation: The arrays we are merging are [1] and [].
The result of the merge is [1].
```

Example 3:

```
Input: nums1 = [0], m = 0, nums2 = [1], n = 1
Output: [1]
Explanation: The arrays we are merging are [] and [1].
The result of the merge is [1].
Note that because m = 0, there are no elements in nums1. The 0 is only there to ensure the merge result can fit in nums1.
```

Constraints:

```
nums1.length == m + n
nums2.length == n
0 <= m, n <= 200</li>
1 <= m + n <= 200</li>
-10<sup>9</sup> <= nums1[i], nums2[j] <= 10<sup>9</sup>
```

Follow up: Can you come up with an algorithm that runs in O(m + n) time?
